BilScript Language

Complete BNF Description

I. PROGRAM

```
<program> ::= <BP><statement_list><EP>
<statement_list> ::= <statement> | <statement> <statement_list>
<statement> ::= <comment>
| <if_else>
| <assignment>
| <loop>
| <output>
| <initialize_list>
| <function_list>
<comment> ::= <comment_op> <word_list>
```

II. LOOP

```
<loop> ::= <while_statement> | <for_statement>
<while_statement> ::= <while> <LP> <logic_list> <RP> <LB> <statement_list> <RB>
<for_statement> ::= <for> <LP> <initialize_list> <semicolon> <logic_list> <semicolon>
<assignment_list> <RP> <LB> <statement_list> <RB>
```

III. INPUT AND OUTPUT

```
<input_expression> ::= cin<LP><algebra_list><RP>
<output_expression> ::= cout<LP><algebra_list><RP>
```

IV. TYPES

```
<var_dec> ::= <variable_type><word><semicolon>

<variable_type> ::= <int_dec>
| <char_dec>
| <string_dec>
| <bool_dec>
| <float_dec>
```

$\langle \text{bool_dec} \rangle ::= \text{bool}$
 $\langle \text{int_dec} \rangle ::= \text{int}$
 $\langle \text{string_dec} \rangle ::= \text{string}$
 $\langle \text{char_dec} \rangle ::= \text{char}$
 $\langle \text{float_dec} \rangle ::= \text{float}$
 $\langle \text{void_dec} \rangle ::= \text{void}$
 $\langle \text{sign} \rangle ::= + \mid -$
 $\langle \text{var} \rangle ::= \langle \text{char} \rangle \mid \langle \text{int} \rangle \mid \langle \text{bool} \rangle \mid \langle \text{float} \rangle \mid \langle \text{string} \rangle$
 $\langle \text{bool} \rangle ::= \text{true} \mid \text{false}$
 $\langle \text{int} \rangle ::= 0 \mid \langle \text{non_zero} \rangle \langle \text{digit_list} \rangle$
 $\langle \text{digit_list} \rangle ::= \langle \text{digit} \rangle \mid \langle \text{digit} \rangle \langle \text{digit_list} \rangle$
 $\langle \text{signed_int} \rangle ::= \langle \text{sign} \rangle \langle \text{int} \rangle$
 $\langle \text{digit} \rangle ::= 0 \mid \langle \text{non_zero} \rangle$

 $\langle \text{non_zero} \rangle ::= 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7 \mid 8 \mid 9$

 $\langle \text{float} \rangle ::= \langle \text{signed_int} \rangle . \langle \text{digitlist} \rangle \mid \langle \text{int} \rangle . \langle \text{digit_list} \rangle \mid . \langle \text{digit_list} \rangle$
 $\langle \text{char} \rangle ::= \text{'letter'} \mid \text{'digit'}$
 $\langle \text{letter} \rangle ::= \text{a} \mid \text{b} \mid \text{c} \mid \text{d} \mid \text{e} \mid \text{f} \mid \text{g} \mid \text{h} \mid \text{i} \mid \text{j} \mid \text{k} \mid \text{l} \mid \text{m} \mid \text{n} \mid \text{o} \mid \text{p} \mid \text{q} \mid \text{r} \mid \text{s} \mid \text{t} \mid \text{u} \mid \text{v} \mid \text{w} \mid \text{x} \mid \text{y} \mid \text{z} \mid \text{A} \mid \text{B} \mid \text{C} \mid \text{D} \mid \text{E} \mid \text{F} \mid \text{G} \mid \text{H} \mid \text{I} \mid \text{J} \mid \text{K} \mid \text{L} \mid \text{M} \mid \text{N} \mid \text{O} \mid \text{P} \mid \text{Q} \mid \text{R} \mid \text{S} \mid \text{T} \mid \text{U} \mid \text{V} \mid \text{W} \mid \text{X} \mid \text{Y} \mid \text{Z}$
 $\langle \text{word} \rangle ::= \langle \text{char} \rangle \mid \langle \text{char} \rangle \langle \text{word} \rangle$
 $\langle \text{word_list} \rangle ::= \langle \text{word} \rangle \mid \langle \text{word} \rangle \langle \text{space_list} \rangle \langle \text{word_list} \rangle$
 $\langle \text{space_list} \rangle ::= \langle \text{space} \rangle \mid \langle \text{space} \rangle \langle \text{space_list} \rangle$

V. CONDITIONAL STATEMENTS

$\langle \text{arith_op} \rangle ::= \langle \text{add_op} \rangle \mid \langle \text{mult_op} \rangle \mid \langle \text{subtract_op} \rangle \mid \langle \text{div_op} \rangle \mid \langle \text{mod_op} \rangle$

 $\langle \text{algebra_list} \rangle ::= \langle \text{var} \rangle \mid \langle \text{var} \rangle \langle \text{arith_op} \rangle \langle \text{algebra_list} \rangle$
 $\langle \text{alg_eq} \rangle ::= \langle \text{arith_op} \rangle \langle \text{assignment_operator} \rangle$
 $\langle \text{and_or} \rangle ::= \langle \text{and} \rangle \mid \langle \text{or} \rangle$

 $\langle \text{logic_list} \rangle ::= \langle \text{logic} \rangle \mid \langle \text{logic} \rangle \langle \text{and_or} \rangle \langle \text{logic_list} \rangle$

 $\langle \text{logic_op} \rangle ::= \langle \text{gt} \rangle \mid \langle \text{gt_eq} \rangle \mid \langle \text{lt} \rangle \mid \langle \text{lt_eq} \rangle \mid \langle \text{eq} \rangle \mid \langle \text{not_eq} \rangle$

 $\langle \text{logic} \rangle ::= \langle \text{not} \rangle \langle \text{logic} \rangle \mid \langle \text{bool} \rangle \mid \langle \text{int} \rangle \langle \text{logic_op} \rangle \langle \text{int} \rangle$
 $\langle \text{if_else} \rangle ::= \langle \text{matched} \rangle \mid \langle \text{unmatched} \rangle$
 $\langle \text{matched} \rangle ::= \text{if} \langle \text{LP} \rangle \langle \text{logic_list} \rangle \langle \text{RP} \rangle \langle \text{LB} \rangle \langle \text{matched} \rangle \langle \text{RB} \rangle \text{else} \langle \text{LB} \rangle$
 $\langle \text{matched} \rangle \langle \text{RB} \rangle \mid \langle \text{statement_list} \rangle$
 $\langle \text{unmatched} \rangle ::= \text{if} \langle \text{LP} \rangle \langle \text{logic_list} \rangle \langle \text{RP} \rangle \langle \text{LB} \rangle \langle \text{statement_list} \rangle \langle \text{RB} \rangle$
 $\mid \text{if} \langle \text{LP} \rangle \langle \text{logic_list} \rangle \langle \text{RP} \rangle \langle \text{LB} \rangle \langle \text{matched} \rangle \langle \text{RB} \rangle \text{else} \langle \text{LB} \rangle \langle \text{unmatched} \rangle \langle \text{RB} \rangle$

VI. INITIALIZE AND ASSIGN STATEMENTS

$\langle \text{initialize_list} \rangle ::= \langle \text{init} \rangle \langle \text{semicolon} \rangle \mid \langle \text{init} \rangle \langle \text{comma} \rangle \langle \text{initialize_list} \rangle$

$\langle \text{init} \rangle ::= \langle \text{int_init} \rangle \mid \langle \text{char_init} \rangle \langle \text{semicolon} \rangle \mid \langle \text{string_init} \rangle \langle \text{semicolon} \rangle \mid \langle \text{boolean_init} \rangle \langle \text{semicolon} \rangle$

$\langle \text{int_init} \rangle ::= \langle \text{int_dec} \rangle \langle \text{word} \rangle \langle \text{assignment_operator} \rangle \langle \text{int} \rangle$

$\langle \text{char_init} \rangle ::= \langle \text{char_dec} \rangle \langle \text{word} \rangle \langle \text{assignment_operator} \rangle \langle \text{char} \rangle$

$\langle \text{string_init} \rangle ::= \langle \text{string_dec} \rangle \langle \text{word} \rangle \langle \text{assignment_operator} \rangle \langle \text{string} \rangle$

$\langle \text{bool_init} \rangle ::= \langle \text{bool_dec} \rangle \langle \text{word} \rangle \langle \text{assignment_operator} \rangle \langle \text{string} \rangle$

$\langle \text{float_init} \rangle ::= \langle \text{float_dec} \rangle \langle \text{word} \rangle \langle \text{assignment_operator} \rangle \langle \text{float} \rangle$

$\langle \text{assignment} \rangle ::= \langle \text{var} \rangle \langle \text{assignment_operator} \rangle \langle \text{algebra_list} \rangle$

$\mid \langle \text{var} \rangle \langle \text{alg_eq} \rangle \langle \text{algebra_list} \rangle$

$\mid \langle \text{var} \rangle \langle \text{add_op} \rangle \langle \text{add_op} \rangle$

$\mid \langle \text{var} \rangle \langle \text{subtract_op} \rangle \langle \text{subtract_op} \rangle$

$\langle \text{assignment_list} \rangle ::= \langle \text{assignment} \rangle \langle \text{semicolon} \rangle$

$\mid \langle \text{assignment} \rangle \langle \text{semicolon} \rangle \langle \text{assignment_list} \rangle$

VII. PRIMITIVE FUNCTIONS AND FUNCTION DECLARATIONS

$\langle \text{primitive_function_list} \rangle ::= \langle \text{primitive_function} \rangle$

$\mid \langle \text{primitive_function} \rangle \langle \text{primitive_function_list} \rangle$

$\langle \text{primitive_function} \rangle ::= \langle \text{read_temp} \rangle$

$\mid \langle \text{read_hum} \rangle$

$\mid \langle \text{read_airp} \rangle$

$\mid \langle \text{read_airq} \rangle$

$\mid \langle \text{read_light} \rangle$

$\mid \langle \text{read_sound} \rangle$

$\mid \langle \text{read_s7} \rangle$

$\mid \langle \text{read_s8} \rangle$

$\mid \langle \text{read_s9} \rangle$

$\mid \langle \text{read_s10} \rangle$

$\mid \langle \text{read_timestamp} \rangle$

$\langle \text{read_temp} \rangle ::= \text{readTemperature}()$

$\langle \text{read_hum} \rangle ::= \text{readHumidity}()$

$\langle \text{read_airp} \rangle ::= \text{readAirPressure}()$

$\langle \text{read_airq} \rangle ::= \text{readAirQuality}()$

$\langle \text{read_light} \rangle ::= \text{readLight}()$

```

<read_sound>::= readSound()
<read_s7>::= readS7()
<read_s8>::= readS8()
<read_s9>::= readS9()
<read_s10>::= readS10()
<read_timestamp>::= readTimer()
<function_list>::= <function> | <function> <function_list>

<function>::=<variable_type> <word> <LP> <param_list> <RP> <LB> <statement_list>
<return_statement> <RB>
    | <void_dec> <word> <LP> <param_list> <RP> <LB> <statement_list> <RB>

<param_list>::= <param> | <param> <param_list>
<param>::= <variable_type> <var>
<return_statement>::= <return> <var>
<url>::=<scheme_name><host_name><port_number><path_list><query_str>
    | <scheme_name><host_name><port_number><path_list><query_str><frag_ident>

<con_url>::= connectURL(<url>)
<send_int>::= SEND_INT
<receive_int>::= RECEIVE_INT
<scheme_name>::= SCHEME_NAME
<host_name>::= HOST_NAME
<port_number>::= PORT_NUM

<sw8>::=SWITCH_8
<sw9>::=SWITCH_9
<sw10>::=SWITCH_10

```

VIII. SYMBOLS

<BP> ::= begin_program
<EP> ::= end_program
<LP> ::= (
<RP> ::=)
<LB> ::= {
<RB> ::= }
<LSB> ::= [
<RSB> ::=]
<while> ::= while
<return> ::= return
<newline> ::= /n
<semicolon> ::= ;
<comma> ::= ,
<space> ::= “ ”
<and> ::= &&
<or> ::= ||
<assignment_operator> ::= =
<equal> ::= ==
<not_equal> ::= !=
<not> ::= !
<add_op> ::= +
<subtract_op> ::= -
<div_op> ::= /
<mult_op> ::= *
<mod_op> ::= %
<gt> ::= >
<gt_eq> ::= >=
<lt> ::= <
<lt_eq> ::= <=
<comment_op> ::= //

EXPLANATIONS

I. Program

<program> ::= <BP><statement_list><EP>

In our language program has to start with begin_program and end with end_program. This syntax also decides what to write inside of a program.

<statement_list> ::= <statement> | <statement> <statement_list>

<statement> ::= <comment>

| <if_else>

| <assignment>

| <loop>

| <output>

| <init_list>

| <function_list>

In our program we allow users to create multiple statements with recursion while these statements can be if,else statements, assignment statements, loops, outputs, initialize and functions.

<comment> ::= <comment_op> <word_list>

We create our comments with a comment operator and word list.

II. Loop

<loop> ::= <while_statement> | <for_statement>

This terminal allows the user to have while and for loops.

<while_statement> ::= <while> <LP> <logic_list> <RP> <LB> <statement_list> <RB>

<for_statement> ::= <for> <LP> <initialize_list> <semicolon> <logic_list> <semicolon>

<assignment_list> <RP> <LB> <statement_list> <RB>

These terminals show the syntaxes of while and for loops. In the while loop first, the user should write a “while” special word then inside parentheses there will be a logic list and finally there will be a statement list inside of the loop. In for loop, its syntax is first write “for” special case word then there will be initialization then logic list and assignment list which are separated by semicolons. After these there will be a statement list inside the Brackets.

III. Input and Output

<input_expression> ::= cin<LP><algebra_list><RP>

This terminal allows the program to have user input which syntax is “cin” special case word and two parentheses. Inside of the parentheses there will be an algebra list which allows the user to enter any type that he/she wants.

<output_expression> ::= cout<LP><algebra_list><RP>

This terminal allows the program to have output for users. Which syntax is “cout” special case word and two parentheses. Inside of the parentheses there will be an algebra list which allows the user to enter any type that he/she wants.

IV. Types

<var_dec> ::= <variable_type> <word> <semicolon>

This terminal allows users to declare variables. It's syntax is first decide variable type then variable name and end with semicolon.

<variable_type> ::= <int_dec>

| <char_dec>

| <string_dec>

| <bool_dec>

| <float_dec>

Our language allows user to create integer, character, string, boolean and float variables.

<bool_dec> ::= bool

<int_dec> ::= int

<string_dec> ::= string

<char_dec> ::= char

<float_dec> ::= float

<void_dec> ::= void

Declarations of the variable types.

<sign> ::= + | -

This terminal allows users to have signed integers and floats.

<var> ::= <char> | <int> | <bool> | <float> | <string>

This terminal shows the variable types.

<bool> ::= true | false

This terminal shows booleans can only have 2 types which are true or false.

<int> ::= 0 | <non_zero> <digit_list>

This terminal allows us to create integers by recursively adding digits.

<signed_int> ::= <sign> <int>

This terminal shows the syntax of signed integers.

<digit> ::= 0 | <non_zero>

<non_zero> ::= 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9

<digit_list> ::= <digit> | <digit> <digit_list>

These terminals show how the digits and digit lists are created.

<float> ::= <signed_int> . <digitlist> | <int> . <digit_list> | . <digit_list>

This terminal shows the syntax of float variable type.

<char> ::= '<letter>' | '<digit>'

This terminal shows the syntax of character variable type.

<letter> ::= a | b | c | d | e | f | g | h | i | j | k | l | m | n | o | p | q | r | s | t | u | v | w | x | y | z | A | B | C | D | E | F | G | H | I | J | K | L | M | N | O | P | Q | R | S | T | U | V | W | X | Y | Z

<word> ::= <char> | <char> <word>

<word_list> ::= <word> | <word> <space_list> <word_list>

These terminals show how words and sentences have been created in our program.

<space_list> ::= <space> | <space> <space_list>

This terminal allows users to create space or multiple spaces by recursion.

V. Conditional Statements

<arith_op> ::= <add_op> | <mult_op> | <subtract_op> | <div_op> | <mod_op>

In our program there can be 5 different arithmetic operations made. These are addition, subtraction, multiplication, division and modulo.

<algebra_list> ::= <var> | <var> <arith_op> <algebra_list>

Algebra list allows us to create either variables alone or arithmetic operations between variables.

<alg_eq> ::= <arith_op><assignment_operator>

This terminal allows us to assign arithmetic operations.

<and_or> ::= <and> | <or>

This terminal shows the “and” and “or” logical expressions.

<logic_list> ::= <logic> | <logic> <and_or> <logic_list>

This terminal shows the logic list with “and” or “or” operations.

<logic_op> ::= <gt> | <gt_eq> | <lt> | <lt_eq> | <eq> | <not_eq>

In our program there can be 6 different logical comparisons.

<logic> ::= <not> <logic> | <bool> | <int> <logic_op> <int>

This terminal shows the not operation with boolean and logical operation between integers.

<if_else> ::= <matched> | <unmatched>

In our language if else are decided by matched and unmatched statements.

<matched> ::= if <LP> <logic_list> <RP> <LB> <matched> <RB> else <LB>

<matched> <RB> | <statement_list>

This terminal shows the matched if statement and syntax of it.

<unmatched> ::= if <LP> <logic_list> <RP> <LB> <statement_list> <RB>

**| if <LP> <logic_list> <RP> <LB> <matched> <RB> else <LB> <unmatched>
<RB>**

This terminal shows the unmatched if else statement and syntax of it. This also allows user to have multiple if statements.

VI. Initialize and Assign Statements

<initialize_list> ::= <init> <semicolon> | <init> <comma> <initialize_list>

<init> ::= <int_init> | <char_init> <semicolon> | <string_init> <semicolon> |

<boolean_init> <semicolon>

Initialize list and init allow recursive and flexible use of already defined variable initialize annotations.

<int_init> ::= <int_dec> <word> <assignment_operator> <int>

<char_init> ::= <char_dec> <word> <assignment_operator> <char>

<string_init> ::= <string_dec> <word> <assignment_operator> <string>

<bool_init> ::= <bool_dec> <word> <assignment_operator> <string>

<float_init> ::= <float_dec> <word> <assignment_operator> <float>

In order to avoid definition confusion and not create ambiguity, we have provided separate initialize definition for all variable types. These definitions allow the user to assign a value to the variable while defining a variable, by controlling the variable type.

<assignment_list> ::= <assignment> <semicolon>

| <assignment> <semicolon> <assignment_list>

Assignment list allows us to use assignment operations in a recursive way.

<assignment> ::= <var> <assignment_operator> <algebra_list>

| <var> <alg_eq> <algebra_list>

| <var> <add_op> <add_op>

| <var> <subtract_op> <subtract_op>

Assignment terminal allows us to perform simple mathematical operations with our variables. It also provides the ability to write variables by subtracting one from itself and adding one to itself at once (i++, i--)

VII. Primitive Functions and Function Declarations

<primitive_function_list> ::= <primitive_function>

| <primitive_function> <primitive_function_list>

<primitive_function> ::= <read_temp>

| <read_hum>

| <read_airp>

| <read_airq>

| <read_light>

| <read_sound>

| <read_s7>

| <read_s8>

| <read_s9>

| <read_s10>

| <read_timestamp>

Primitive function list allows us to call our primitive functions (sensors) according to the user's request. Primitive function consists of 10 different sensors and timestamps

<read_temp> ::= readTemperature()

It is a primitive sensor for detecting temperature

<read_hum> ::= readHumidity()

It is a primitive sensor for detecting humidity

<read_airp> ::= readAirPressure()

It is a primitive sensor for detecting air pressure

<read_airq> ::= readAirQuality()

It is a primitive sensor for detecting air quality

<read_light> ::= readLight()

It is a primitive sensor for detecting light

<read_sound> ::= readSound()

It is a primitive sensor for detecting sound

<read_s7> ::= readS7()

<read_s8> ::= readS8()

<read_s9> ::= readS9()

<read_s10> ::= readS10()

read_s7 read_s8 read_s9 and read_s10 are some additional sensors we provide for users. Can be defined later by user.

<read_timestamp>::= readTimer()

A timer that returns the current timestamp

<function_list>::= <function> | <function> <function_list>

<function>::=<variable_type> <word> <LP> <param_list> <RP> <LB>

<statement_list> <return_statement> <RB>

| <void_dec> <word> <LP> <param_list> <RP> <LB> <statement_list> <RB>

Function list allows us to use the terminals in the function in a flexible and recursive way.

The function terminal allows user to specify the type of the function, to name the function, to write parameters to the function and to write statements in it.

<param_list>::= <param> | <param> <param_list>

<param>::= <variable_type> <var>

Paramlist and param allow us to define the parameters that we will use inside the functions.

<return_statement>::= <return> <var>

It allows us to return a variable at the end of the function.

<url>::=<scheme_name><host_name><port_number><path_list><query_str>

|<scheme_name><host_name><port_number><path_list><query_str><frag_id>

It allows the user to create the url

<con_url>::= connectURL(<url>)

Mechanism to define a connection to a given URL

<send_int>::= SEND_INT

<receive_int>::= RECEIVE_INT

<scheme_name>::= SCHEME_NAME

<host_name>::= HOST_NAME

<port_number>::= PORT_NUM

<path_list>::= <path> | <path><path_list>

<path>::= DIR_NAME<div_op>

<query_str>::=QUERY_STR

<frag_ident>::=FRAGMENT_IDENT

These are the fragments of the Url that are defined in our language.

<sw1>::=SWITCH_1

<sw2>::=SWITCH_2

<sw3>::=SWITCH_3

<sw4>::=SWITCH_4

<sw5>::=SWITCH_5

<sw6>::=SWITCH_6

<sw7>::=SWITCH_7

<sw8>::=SWITCH_8

<sw9>::=SWITCH_9

<sw10>::=SWITCH_10

There are 10 switches that can be set as on/off to control some actuators.

READABILITY

In terms of readability, our language can be seen as a good option since every expression or every declaration does not have complex syntaxes and this allows users to understand the basics of our language and syntax of it. While writing and creating our language we have examined other popular programming languages and due to that we have similarities in many operations that have been created and done inside of our language. If someone is familiar with popular programming languages they can easily read our language.

WRITABILITY

In terms of writability, our language mostly consists of basic operations and predefined functions. As it was stated in readability our language does not have complex structure while creating expressions and declarations and this allows users to write easily in our language. Since the structure of our language can be seen as familiar to other popular programming languages, if someone is familiar with them they can easily write in our language.

RELIABILITY

Since our language has been created for simple operations and predefined functions it has high reliability on small sized projects. Since our language does not offer any complex structure or deep level design its reliability depends mostly on different situations. While creating this language our aim was to complete small sized works and simple operations; its reliability will be lower on intricate and highly detailed tasks and projects. Except for those things our language can be seen as reliable.

HOW DID WE DEFINE NONTRIVIAL TOKENS IN OUR LANGUAGE?

Most of our non-trivial tokens, the comment `"/"` is derived from Java. This is primarily because we are more accustomed to Java than any other programming language. But in addition to drawing inspiration from Java, C and Kotlin, we also created our own input/output syntax which is similar to C++. The other justification for using them is that we also believed they were easier to write and read, so we combined them into a single language.
